

Two things this figure refuses to draw. There is no number line here, and no arrow accumulating along one. A sequence of expenditures cannot be summed to predict a later measurement — so a path integral of a per-tick term is not an approximation of this quantity, it is a different quantity. And no cross-frame accounting: the equality holds only where both sides are instantiated on one dimension, which is a precondition, not a formality.

THEORY FIGURE. Nothing here is instrumented. The only occurrence of this construct in the reference tree computes a cumulative per-tick sum in host arithmetic and disclaims itself as such — it is the thing this diagram says not to build.
